The Fuel of Tomorrow

**Is Already
Here!**

A Realistic Solution to Lowering Carbon Emissions

We are as concerned about global warming and greenhouse gas emissions as you are. That's why we deliver Bioheat® fuel to your home.

Bioheat® is a blend of traditional heating oil and a renewable low carbon liquid fuel. The Bioheat you're already using contains between 2% and 20% low carbon liquid fuel (B2 to B20) and is better for the environment than natural gas.

- We deliver Bioheat® because it's our future.
- Replacing petroleum fuels with biofuel can reduce carbon emissions as much as 50 percent or more.*
 - Bioheat® fuel works with your existing heating equipment! No expensive equipment or system conversion needed.
 - Heating with Bioheat® costs less than electric heat.
 - Widespread use of B20 will reduce carbon dioxide emissions equal to removing 1.5 million cars from the road.
 - Renewable liquid fuels use renewable resources, such as plant oils, animal fats and recycled grease that might otherwise pollute landfills and water resources.
 - Coming soon: New, higher blends of Renewable Liquid Fuels that will produce virtually zero greenhouse gas emissions as they heat your home.

**The renewable, low carbon heating
fuel is already here.**

**Learn more about clean, green, reliable
Bioheat® at our website or contact your
local Bioheat® fuel dealer.**
